Binary trees

Binary Search Tree

- **Each node x has:**
 - $key[x]$
 - **Pointers:**
 - $left[x]$
 - $right[x]$
 - $p[x]$

Binary Search Tree

- **Property:** for any node x :
 - For all nodes y in the left subtree of x :
 $key[y] \leq key[x]$
 - For all nodes y in the right subtree of x :
 $key[y] \geq key[x]$
- Given a set of keys, is BST for those keys *unique*?

No uniqueness

What can we do given BST ?

Sort !

INORDER-TREE-WALK(x)

1. **if** $x \neq \text{NIL}$
2. **then** INORDER-TREE-WALK($\text{left}[x]$)
3. print $\text{key}[x]$
4. INORDER-TREE-WALK($\text{right}[x]$)

A *preorder tree walk* prints the root before the values in either subtree, and a *postorder tree walk* prints the root after the values in its subtrees.

Sort ?

Sort ?

Sort ?

Analysis of inorder-walk

Theorem. If x is the root of an n -node subtree, then the call INORDER-TREE-WALK(x) takes $\Theta(n)$ times.

Substitution method

$$T(n) = (c + d)n + c$$

Base case: $n = 0$, $T(0) = (c + d) \cdot 0 + c = c$

For $n > 0$,

$$\begin{aligned} T(n) &= T(k) + T(n - k - 1) + d \\ &= ((c + d)k + c) + ((c + d) \cdot (n - k - 1) + c) + d \\ &= (c + d)n + c - (c + d) + c + d \\ &= (c + d)n + c \end{aligned}$$

Sorting

Does it mean that we can sort n keys in $O(n)$ time?

No.

It just means that building a binary search tree takes $\Omega(n \lg n)$ time
(in the comparison model)

BST as a data structure

- **Operations:**

- *Insert(x)*
- *Delete(x)*
- *Search(k)*

Search

TREE-SEARCH(x, k)

1. **if** $x = \text{NIL}$ or $k = \text{key}[x]$
2. **then return** x
3. **if** $k < \text{key}[x]$
4. **then return** TREE-SEARCH($\text{left}[x], k$)
5. **else return** TREE-SEARCH($\text{right}[x], k$)

Search

ITERATIVE-TREE-SEARCH(x, k)

1. **while** $x \neq \text{NIL}$ **and** $k \neq \text{key}[x]$
2. **do if** $k < \text{key}[x]$
3. **then** $x \leftarrow \text{left}[x]$
4. **else** $x \leftarrow \text{right}[x]$
5. **return** x

On most computers, this version is more efficient.

Minimum and maximum

TREE-MINIMUM(x)

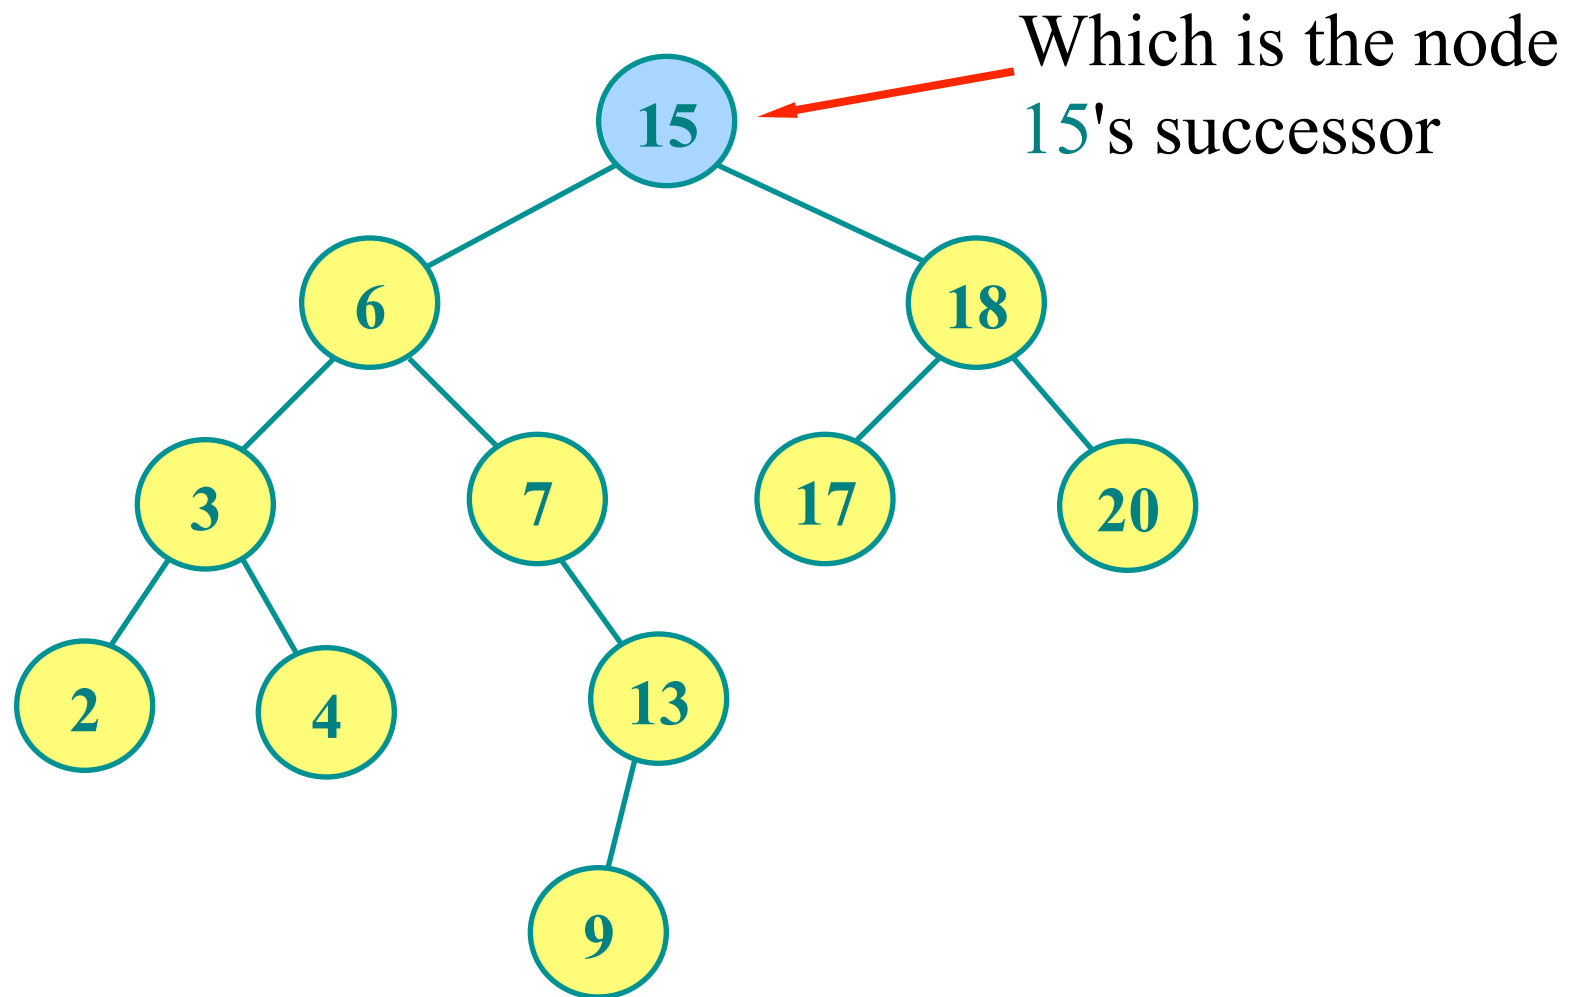

1. **while** $left[x] \neq \text{NIL}$
2. **do** $x \leftarrow left[x]$
3. **return** x

TREE-MAXIMUM(x)

1. **while** $right[x] \neq \text{NIL}$
2. **do** $x \leftarrow right[x]$
3. **return** x

Successor and predecessor

Successor and predecessor

Which is the node
13's successor

Successor and predecessor

TREE-SUCCESSOR(x)

1. **if** $right[x] \neq \text{NIL}$
2. **then return** TREE-MINIMUM($right[x]$)
3. $y \leftarrow p[x]$
4. **while** $y \neq \text{NIL}$ **and** $x = right[y]$
5. **do** $x \leftarrow y$
6. $y \leftarrow p[x]$
7. **return** y

Running time
 $O(h)$

Constructing BST

TREE-INSERT(T, z)

```
1.  $y \leftarrow \text{NIL}$ 
2.  $x \leftarrow \text{root}[T]$ 
3. while  $x \neq \text{NIL}$ 
4.   do  $y \leftarrow x$ 
5.     if  $\text{key}[z] < \text{key}[x]$ 
6.       then  $x \leftarrow \text{left}[x]$ 
7.       else  $x \leftarrow \text{right}[x]$ 
8.  $p[z] \leftarrow y$ 
9. if  $y = \text{NIL}$ 
10. then  $\text{root}[T] \leftarrow z$ 
11. else if  $\text{key}[z] < \text{key}[y]$ 
12.   then  $\text{left}[y] \leftarrow z$ 
13.   else  $\text{right}[y] \leftarrow z$ 
```

Running time
 $O(h)$

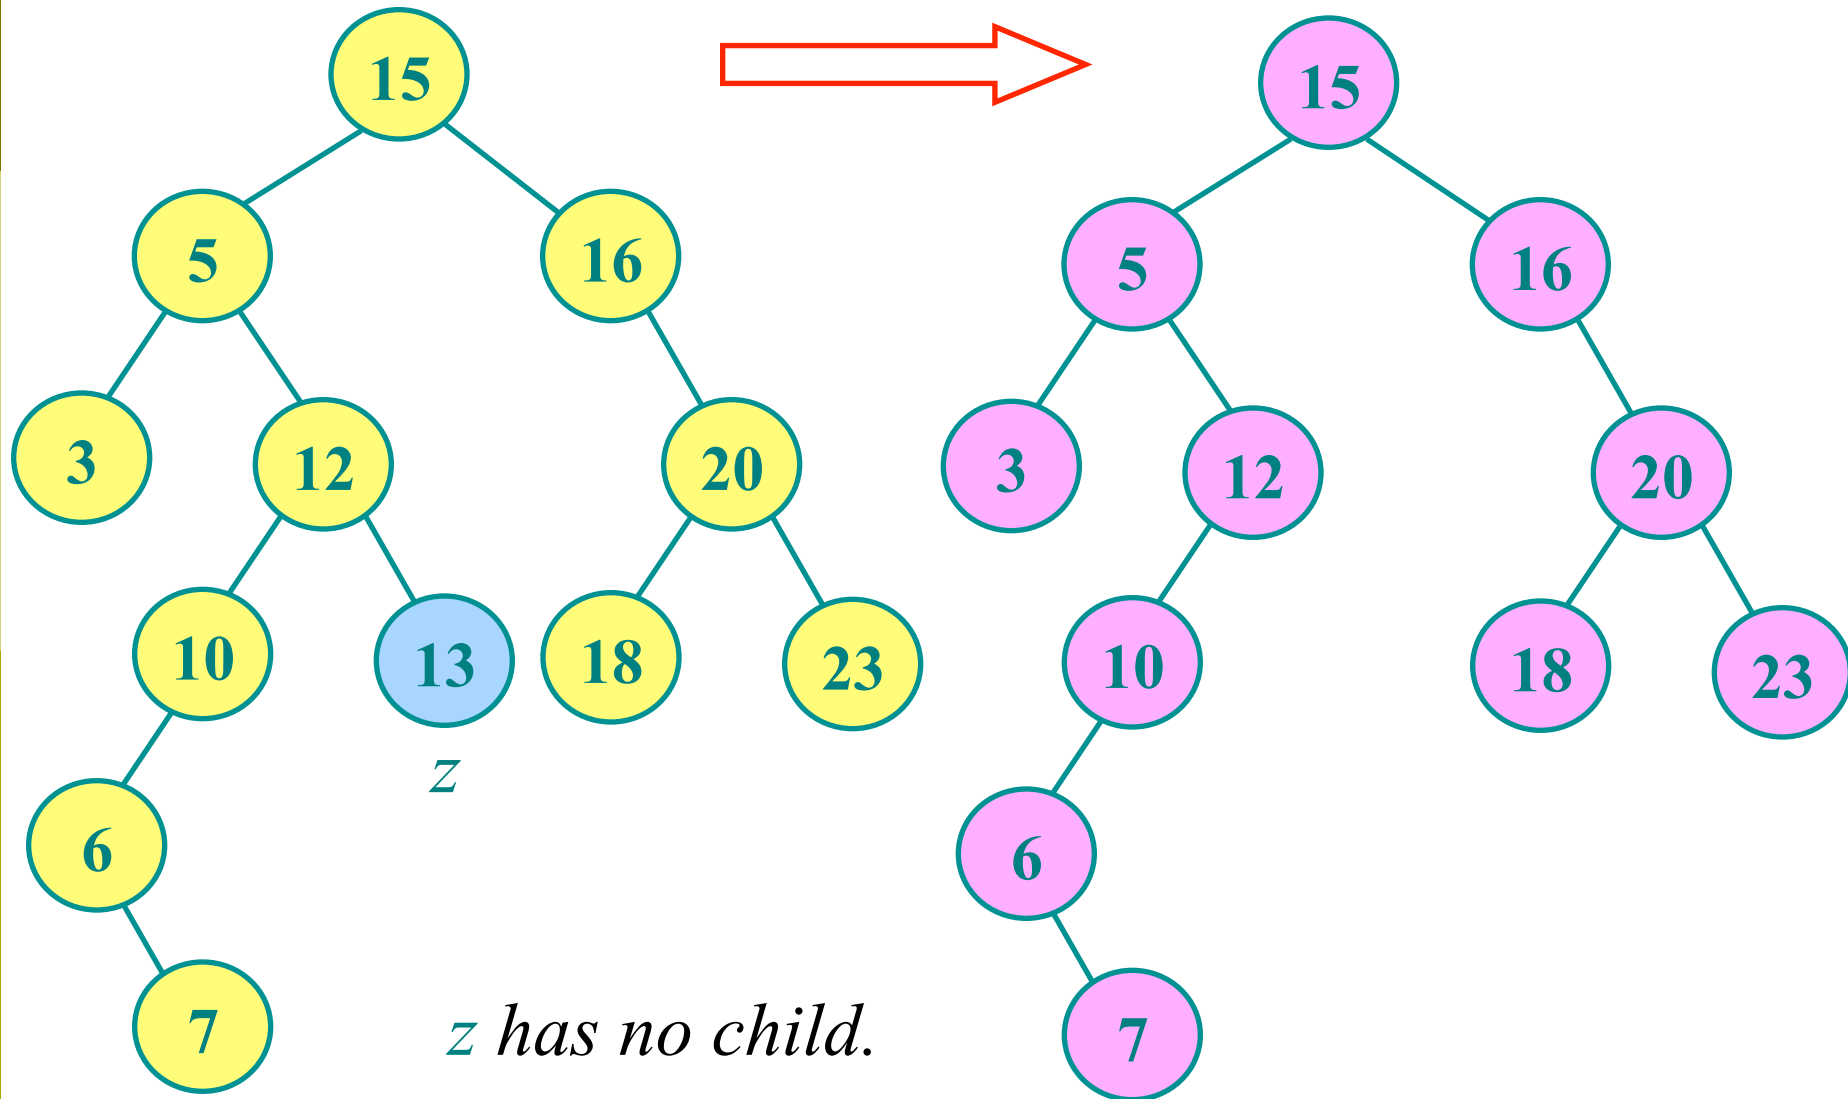

TREE-INSERT($T, 2$)

Analysis

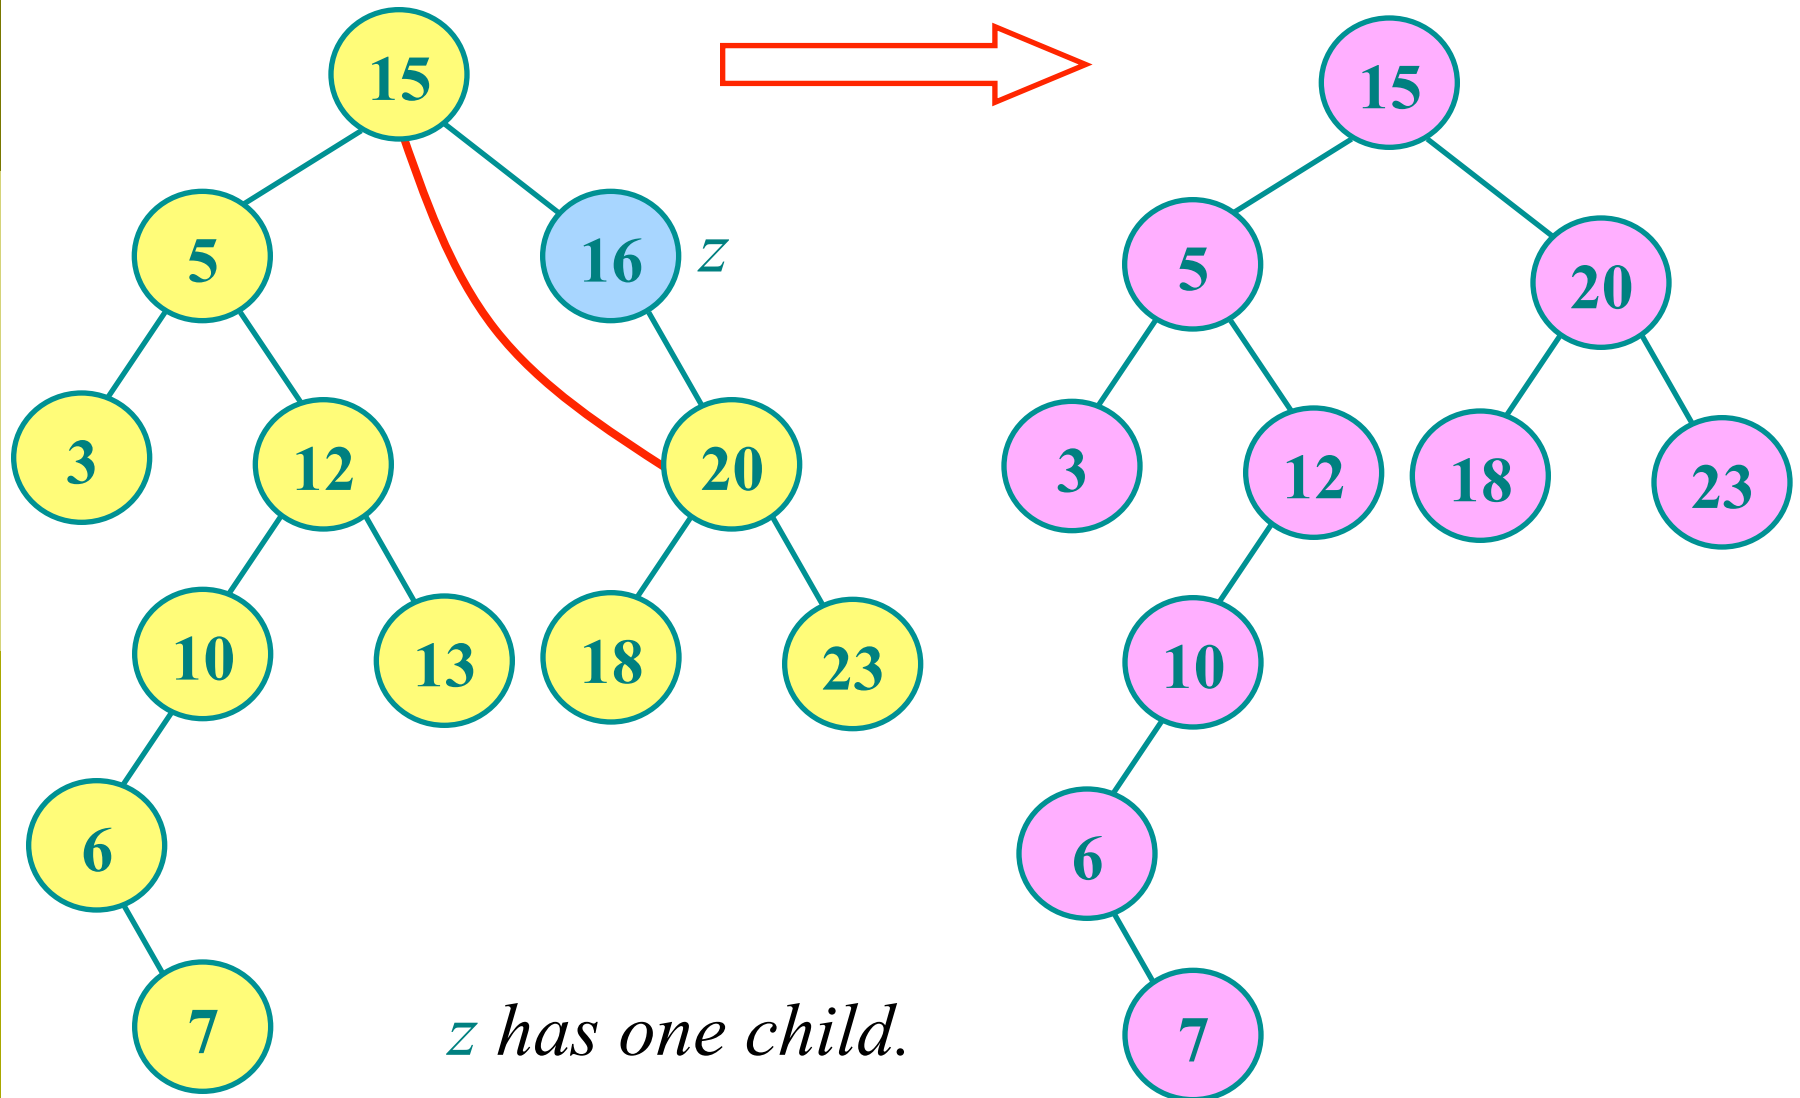

- After we insert n elements, what is the worst possible BST height?
- Pretty bad: $n - 1$
- **Average:** $O(n \lg n)$

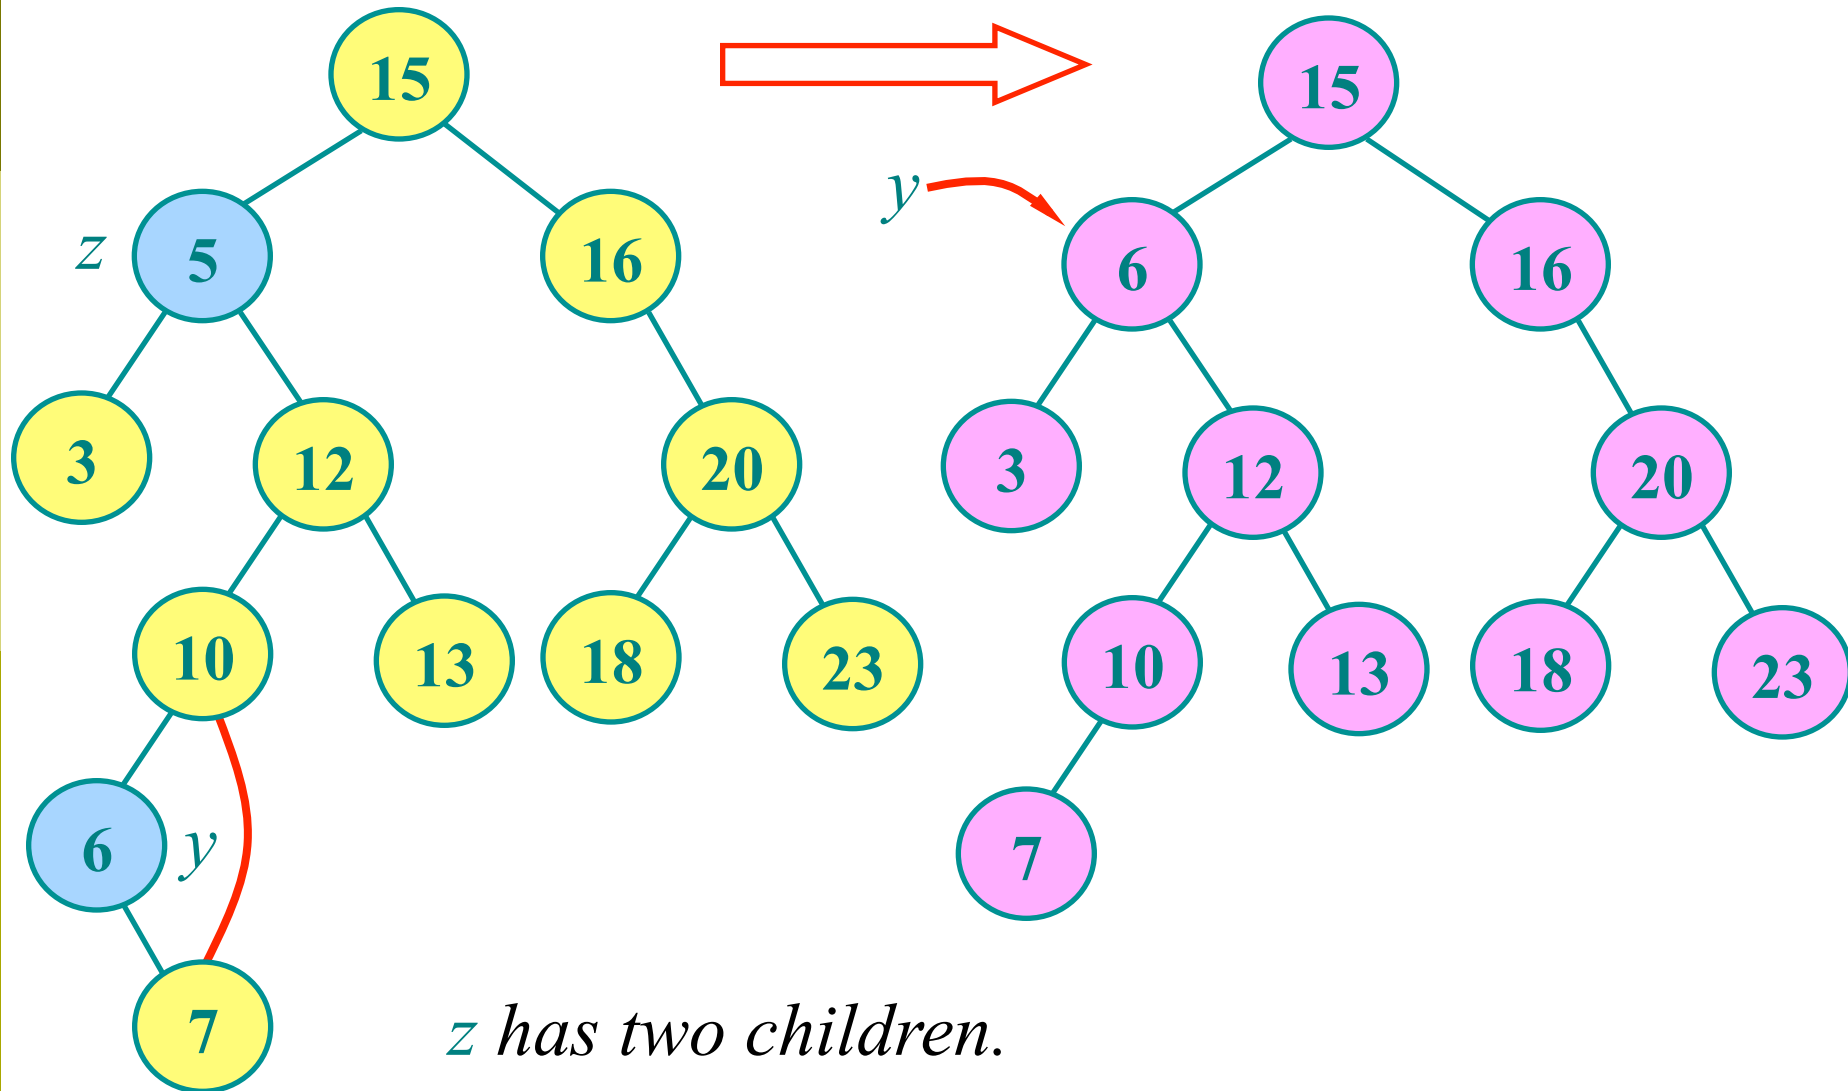

Deletion (case 1)

Deletion (case 2)

Deletion (case 3)

Deletion

TREE-DELETE(T, z)

1. **if** $left[z] = \text{NIL}$ **or** $right[z] = \text{NIL}$
2. **then** $y \leftarrow z$
3. **else** $y \leftarrow \text{TREE-SUCCESSOR}(z)$
4. **if** $left[y] \neq \text{NIL}$
5. **then** $x \leftarrow left[y]$
6. **else** $x \leftarrow right[y]$
7. **if** $x \neq \text{NIL}$
8. **then** $p[x] \leftarrow p[y]$

Note: z 's successor just has one child or z has one child.

Running time:
 $O(h)$

9. **if** $p[y] = \text{NIL}$
10. **then** $root[T] \leftarrow x$
11. **else if** $y = left[p[y]]$
12. **then** $left[p[y]] \leftarrow x$
13. **else** $right[p[y]] \leftarrow x$
14. **if** $y \neq z$
15. **then** $key[z] \leftarrow key[y]$
16. **return** y

Balanced search trees

Balanced search trees,  or how to avoid this even in the worst case

AVL (Adelson-Veskii and Landis) tree is identical to a binary search tree, except that for every node in the tree, the height of the left and right subtrees can differ by at most 1.

AVL trees

Which one is AVL tree?

AVL trees

A *violation* might occur in *four case* when we insert new node to the AVL tree.

Case 1: an insertion into the left subtree of the left child of *R*.

Case2 : an insertion into the right subtree of the left child of *R*.

Case 3: an insertion into the left subtree of the right child of *R*.

Case 4: an insertion into the right subtree of the right child of *R*.

Red-black trees

BSTs with an extra one-bit **color** field in each node.

Red-black properties:

1. Every node is either **red** or **black**.
2. The root is **black**.
3. Every leaf (**NIL**) is **black**.
4. If a node is **red**, then both its children are **black**.
5. All simple paths from any node **x** to a descendant leaf have the same number of **black** nodes.

Example of a red-black tree

Example of a red-black tree

Height of a red-black tree

Height of a red-black tree

Height of a red-black tree

Height of a red-black tree

Height of a red-black tree

Lemma of red-black tree

We call the number of black nodes on any path from, but not including, a node x down to a leaf the **black-height** of the node, denoted $bh(x)$.

Lemma.

A red-black tree with n internal nodes has height at most $2\lg(n + 1)$

Dynamic-set operations **search**, **minimum**, **maximum**, **successor**, and **predecessor** can be implemented in $O(\lg n)$ time on red-black trees.

Proof

Subtree rooted at any node x contains at least $2^{bh(x)} - 1$ internal nodes.

- **Base case:**

Height of x is 0, then x must be a leaf ($nil[T]$), subtree rooted at x contains at least

$$2^{bh(x)} - 1 = 2^0 - 1 = 0 \text{ internal nodes.}$$

- **Inductive:**

Height of a child of x is less than the height of x itself, subtree rooted at x contains at least

$$(2^{bh(x)-1} - 1) + (2^{bh(x)-1} - 1) + 1 = 2^{bh(x)} - 1 \text{ internal nodes.}$$

Proof (cont.)

According to *property 4*, at least the half nodes on any simple path from the root to a leaf, not including the root, must be black.

Consequently, the black-height of the root must be at least $h/2$; thus,

$$n \geq 2^{h/2 - 1} - 1. \implies$$

$$h \leq 2\lg(n + 1). \quad \square$$

Left rotation

LEFT-ROTATE(T, x)

1. $y \leftarrow \text{right}[x]$
2. $\text{right}[x] \leftarrow \text{left}[y]$
3. $p[\text{left}[y]] \leftarrow x$
4. $p[y] \leftarrow p[x]$
5. **if** $p[x] = \text{nil}[T]$
6. **then** $\text{root}[T] \leftarrow y$
7. **else if** $x = \text{left}[p[x]]$
8. **then** $\text{left}[p[x]] \leftarrow y$
9. **else** $\text{right}[p[x]] \leftarrow y$
10. $\text{left}[y] \leftarrow x$

Typical disk drive

B-tree

The *minimum degree* for this **B-tree** is $t = 2$, every node other than the root must have at least 1 keys and every node can contain at most 3 keys (**2-3-4 tree**)

B-tree (1000 keys)

Each internal node and leaf contains 1000 keys.

Definition of B-trees

A **B-tree** T has the following properties:

1. Every node x has the following fields:
 - $n[x]$, the number of keys currently stored in node x ;
 - the $n[x]$ keys themselves, stored in nondecreasing order, so that $key_1[x] \leq key_2[x] \leq \dots \leq key_{n[x]}[x]$;
 - $leaf[x]$, a boolean value that is TRUE if x is a leaf and FALSE if x is an internal node.
2. Each internal node x also contains $n[x] + 1$ has the pointers $c_1[x], c_2[x], \dots, c_{n[x] + 1}[x]$ to its children. Leaf nodes have no children, so their c_i fields are undefined.

Definition of B-trees

3. The keys $key_i[x]$ separate ranges of keys stored in each subtree: if k_i is any key stored in the subtree with root $c_i[x]$, then

$$k_1 \leq key_1[x] \leq k_2 \leq key_2[x] \leq \dots \leq key_{n[x]}[x] \leq k_{n[x] + 1}$$

4. All leaves have the same depth, which is the tree's height h .

Definition of B-trees

5. There are lower and upper bounds on the number of key a node can contain ($t \geq 2$, *minimum degree*)

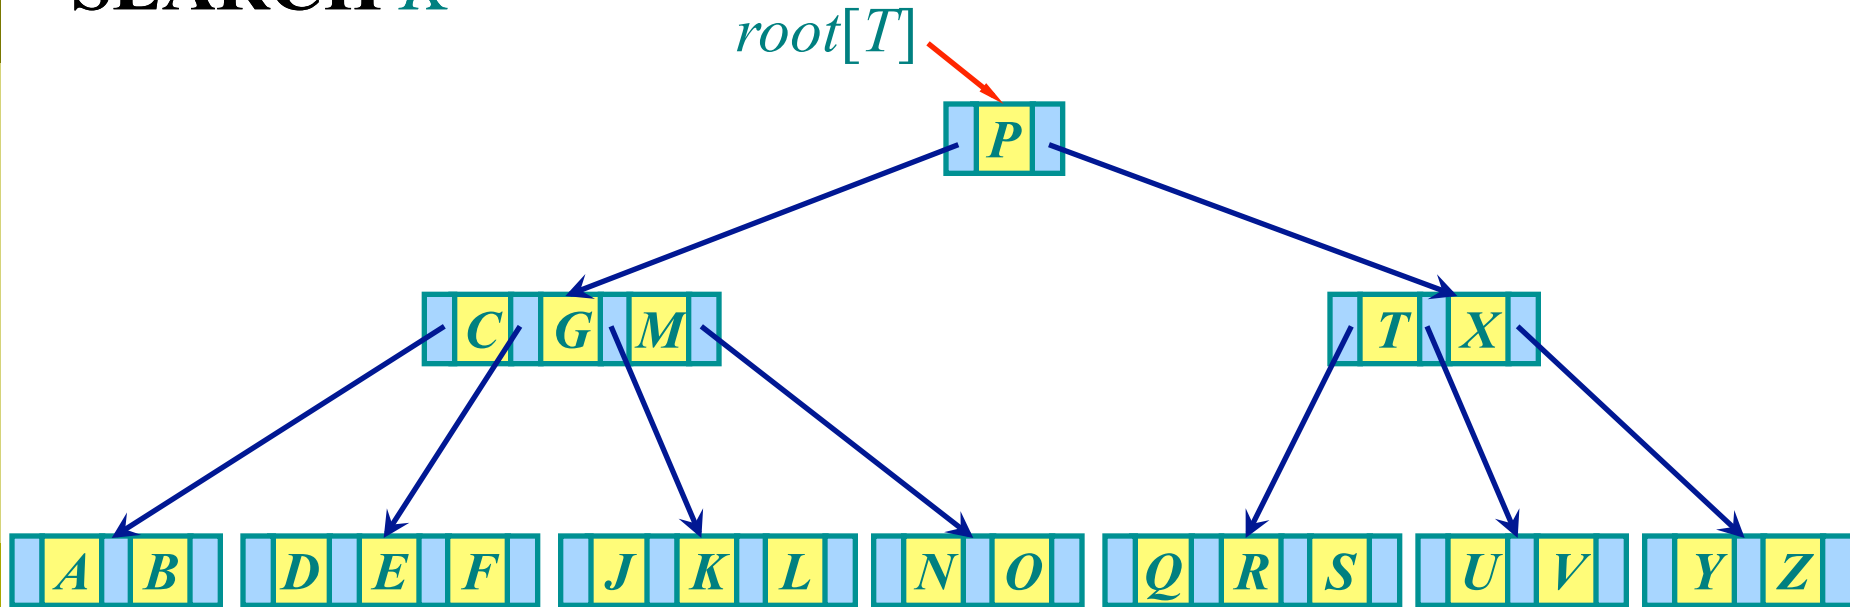

- Every node other than the root must have at least $t - 1$ keys. Every internal node other than the root thus has at least t children;
- Every node can contain at most $2t - 1$ keys. An internal node can have at most $2t$ children.

Theorem. If $n \geq 1$, then for any n -key B-tree T of height h and minimum degree $t \geq 2$,

$$h \leq \log_t n.$$

Case 3: current node has at most 2 keys and the appropriate subtree has 3 keys.

Minimum degree $t = 2$

Insertion (B-tree)

INSERT $F, S, Q, K, C, L, H, T, V, W, M, R, N, P, A, B, X, Y, D, Z, E.$

Case 4: *the appropriate subtree has at most 2 keys (after case 3).*

Minimum degree $t = 2$

Insertion (B-tree)

INSERT *F, S, Q, K, C, L, H, T, V, W, M, R, N, P, A, B, X, Y, D, Z, E.*

Deletion (B-tree)

DELETE Y, *W, Q, X, K, B, H, P* Minimum degree $t = 2$

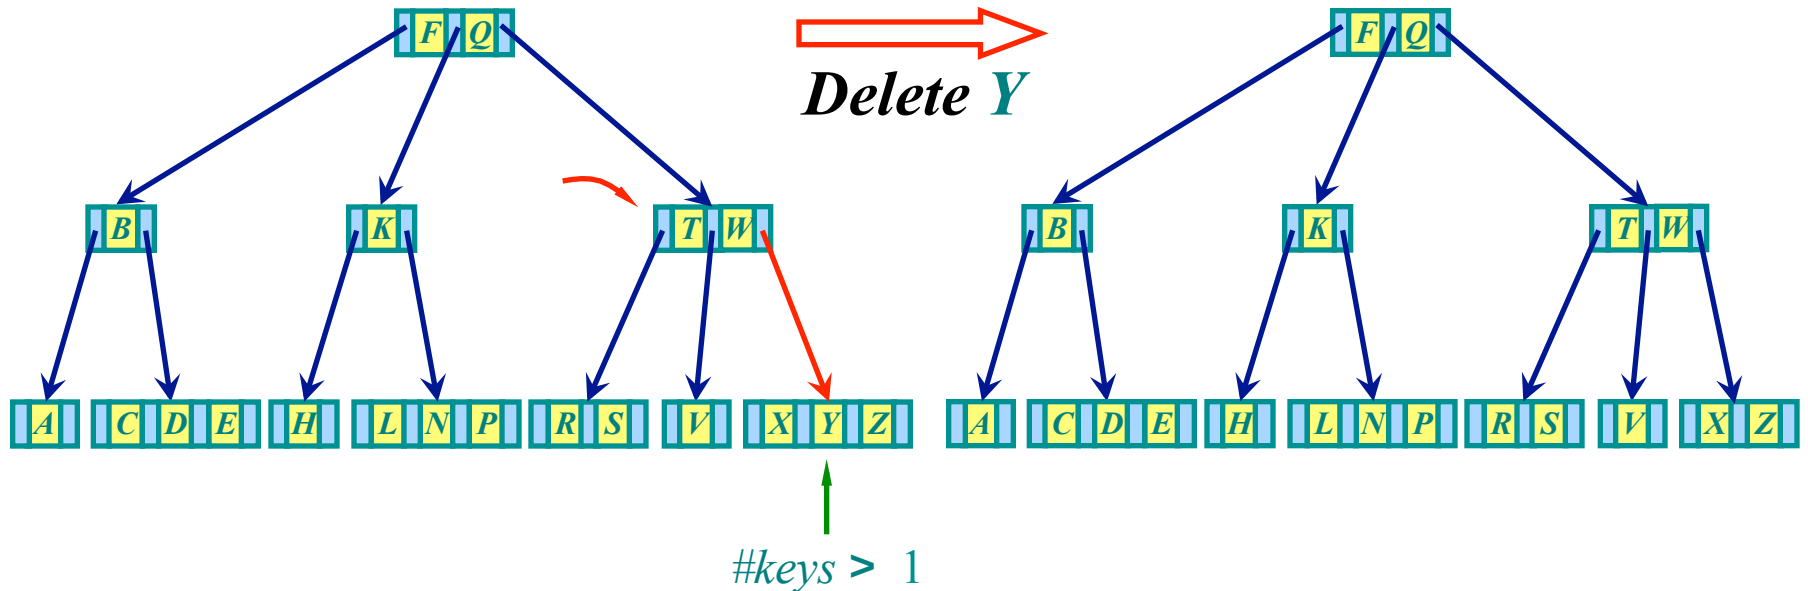

Deletion (B-tree)

DELETE *Y*, *W*, *Q*, *X*, *K*, *B*, *H*, *P* Minimum degree $t = 2$

Deletion (B-tree)

DELETE Y, W, Q, X, K, B, H, P Minimum degree $t = 2$

Case 1: key $k = Y$ is in a leaf.

Deletion (B-tree)

DELETE Y, W, Q, X, K, B, H, P Minimum degree $t = 2$

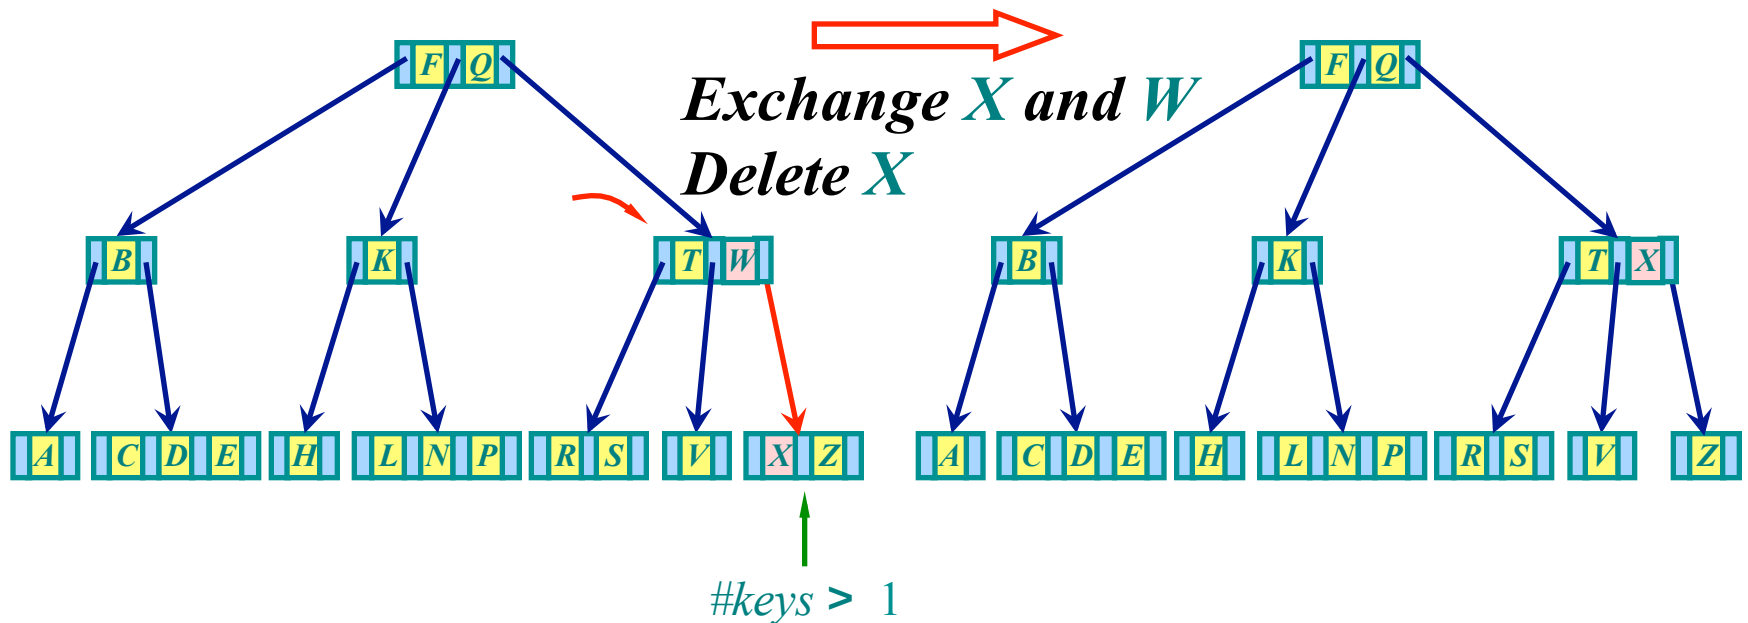

Deletion (B-tree)

DELETE *Y, W, Q, X, K, B, H, P* **Minimum degree** $t = 2$

Deletion (B-tree)

DELETE Y, W, Q, X, K, B, H, P Minimum degree $t = 2$

Case 2-a: key $k = W$ is in a internal node and one of its children that precedes or follows k has at least 2 keys.

Deletion (B-tree)

DELETE F other than W

Minimum degree $t = 2$

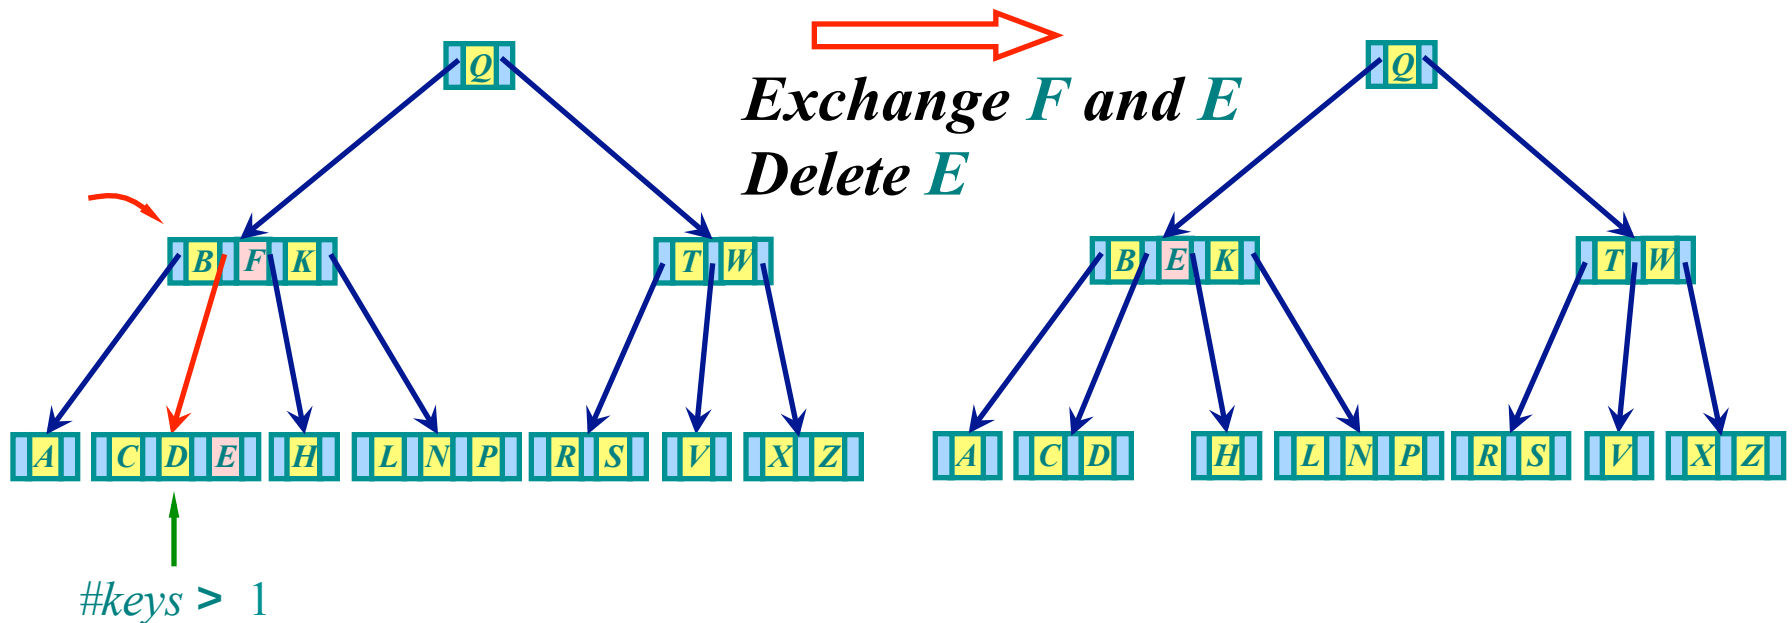

Case 2-b: key $k = F$ is in a internal node and the both of its children that *precedes* or *follows* k only has 1 key.

Deletion (B-tree)

DELETE F other than W

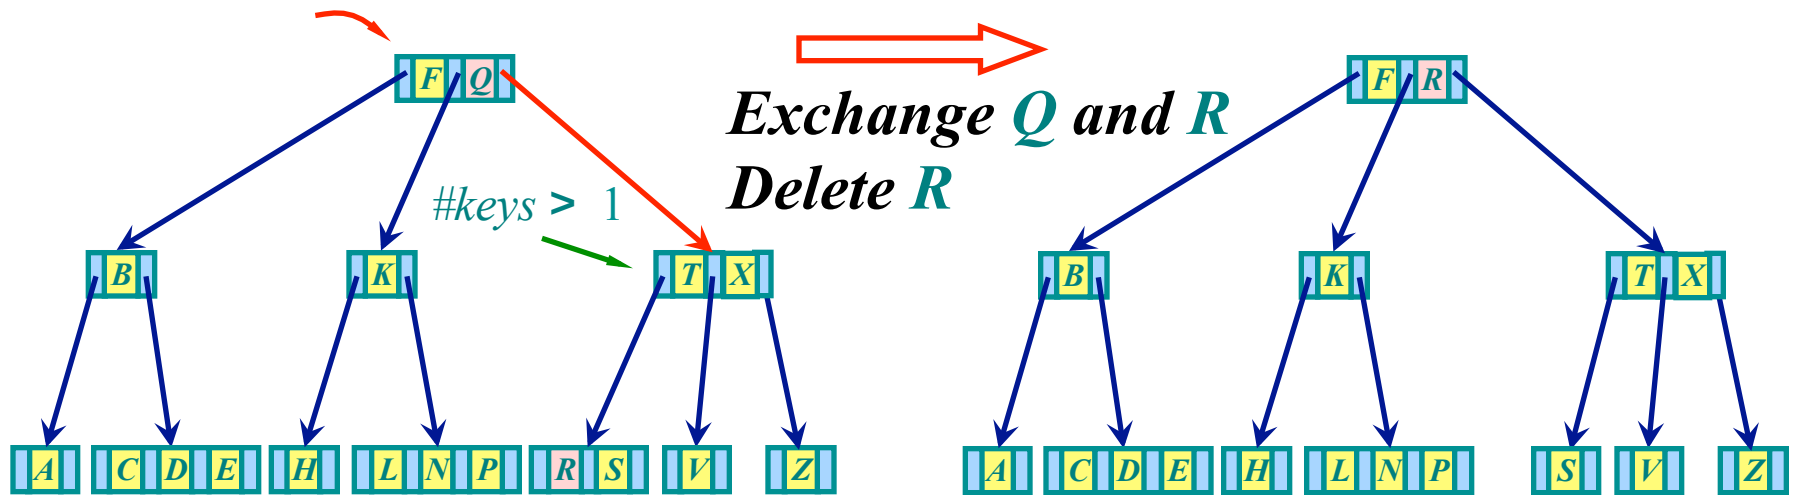

Minimum degree $t = 2$

Case 2-a: key $k = F$ is in a internal node and one of its children that *precedes* or *follows* k has at least 2 keys.

Deletion (B-tree)

DELETE Y, W, Q, X, K, B, H, P Minimum degree $t = 2$

*Which is Q 's **successor**? It is R .*

Case 2-a: key $k = Q$ is in a internal node and one of its children that precedes or follows k has at least 2 keys.

Deletion (B-tree)

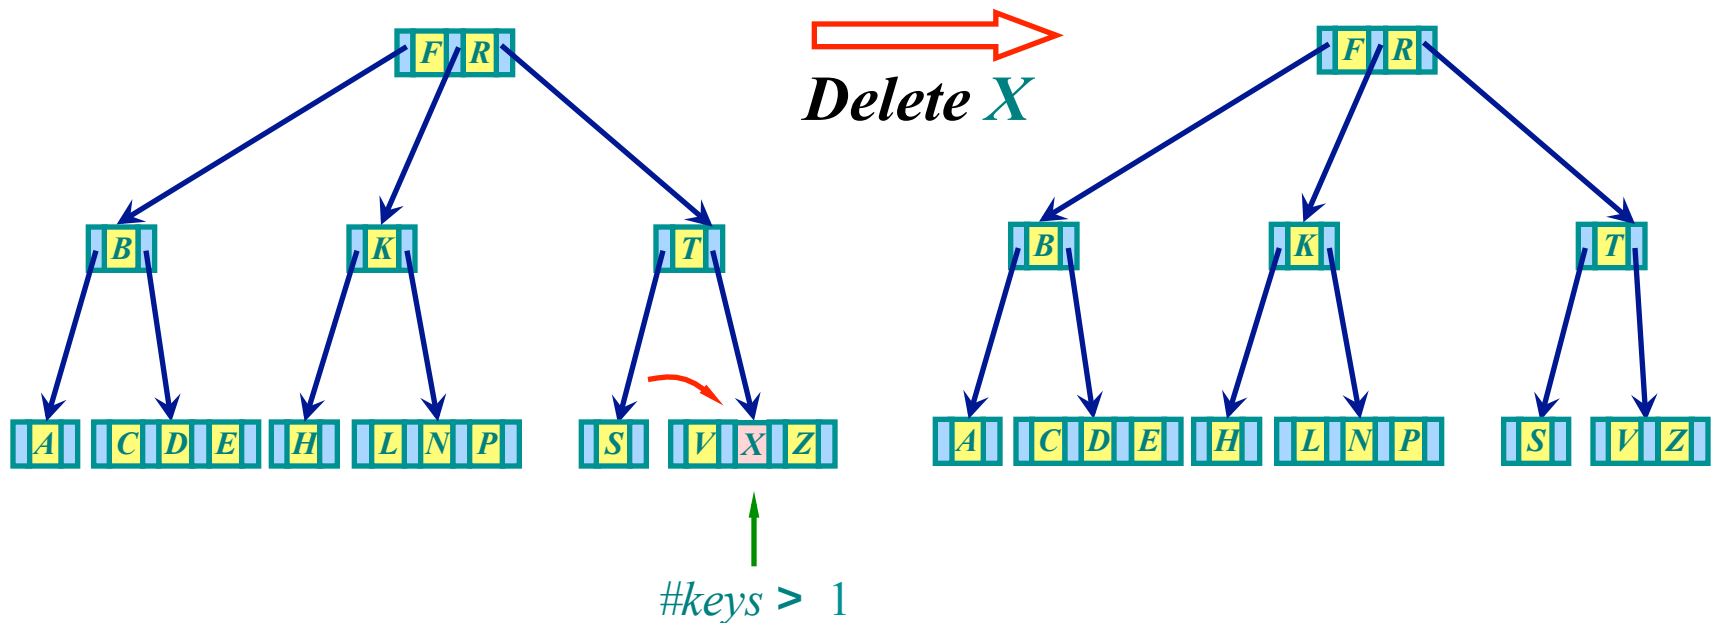

DELETE Y, W, Q, X, K, B, H, P Minimum degree $t = 2$

Case 2-b: key $k = X$ is in a internal node and the both of its children that *precedes* or *follows* k only has 1 key.

Deletion (B-tree)

DELETE Y, W, Q, X, K, B, H, P Minimum degree $t = 2$

Current node is $\{ V, X, Z \}$

Deletion (B-tree)

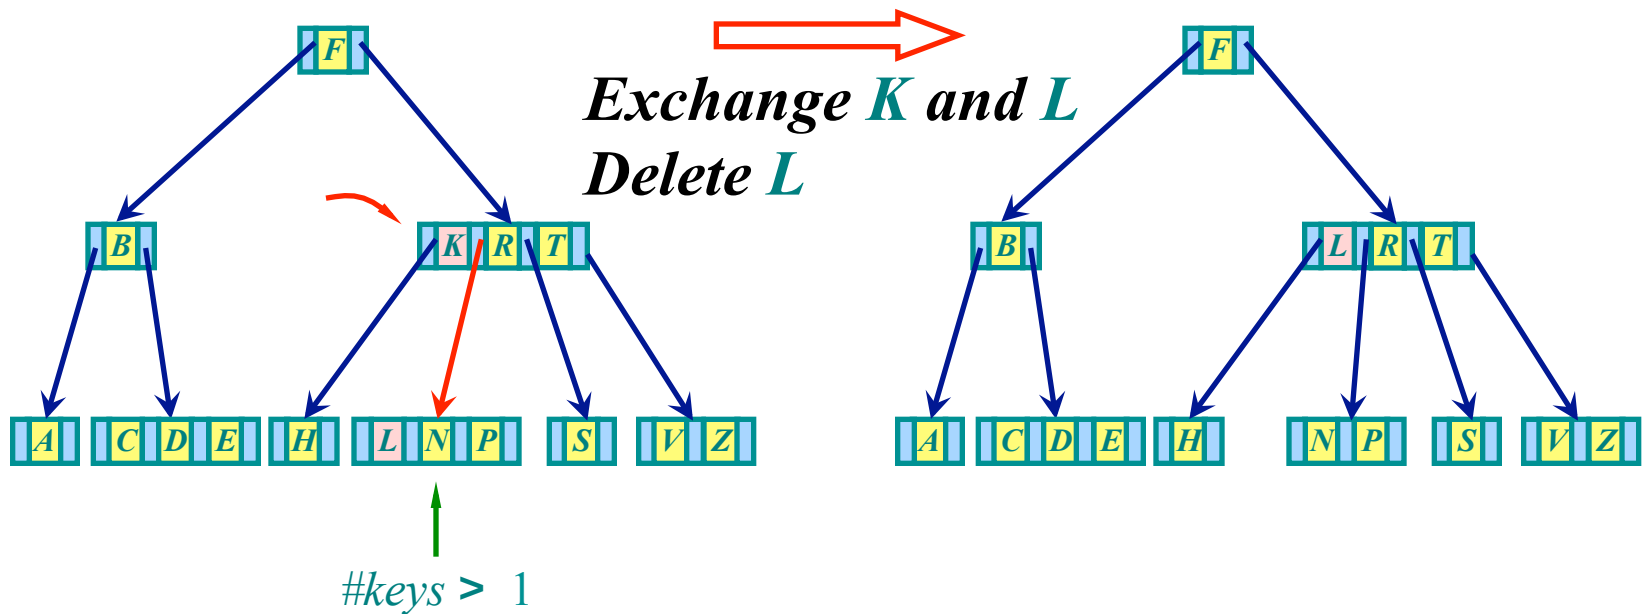

DELETE Y, W, Q, X, K, B, H, P Minimum degree $t = 2$

Case 3-b: key $k = K$ is not present in a internal node and the appropriate subtree that must contain k has only 1 key and the subtree's immediate siblings have only 1 key.

Deletion (B-tree)

DELETE Y, W, Q, X, K, B, H, P Minimum degree $t = 2$

Case 2-a: key $k = K$ is in a internal node and one of its children that precedes or follows k has at least 2 keys.

Deletion (B-tree)

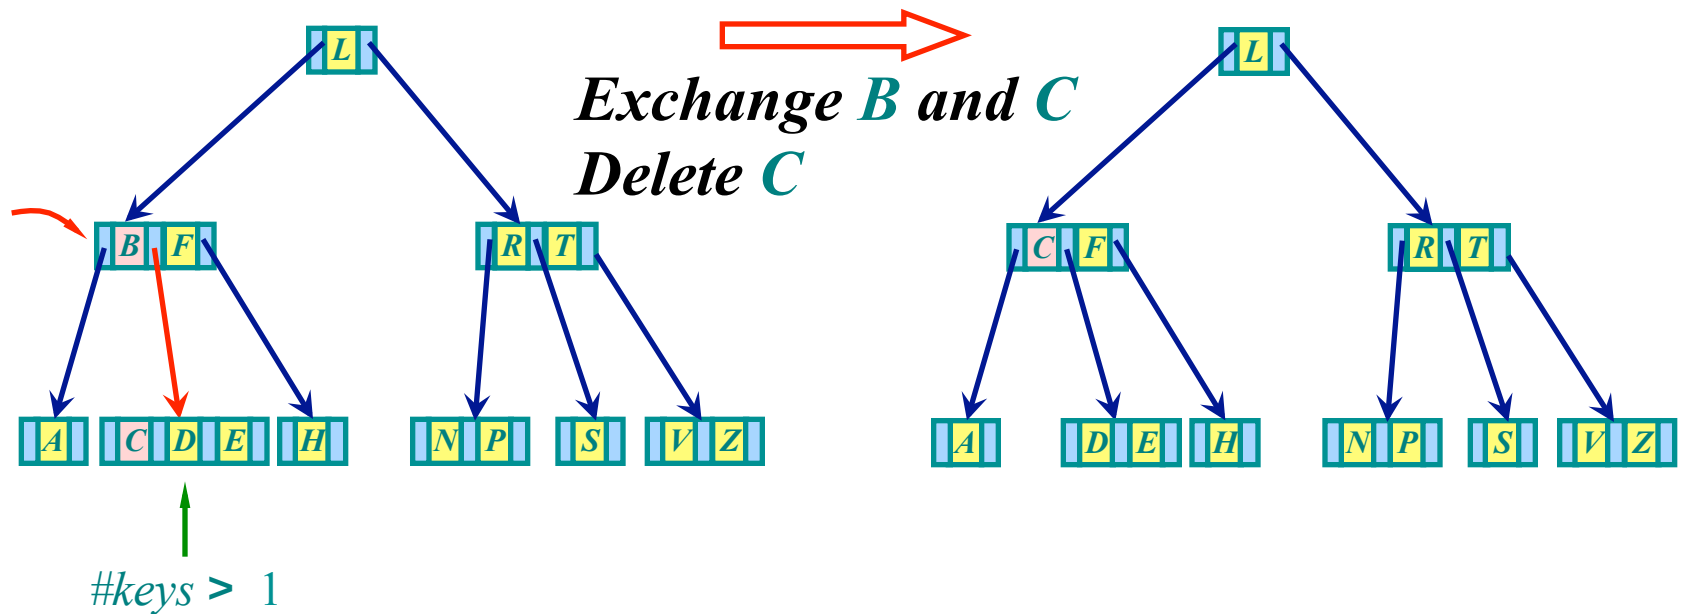

DELETE Y, W, Q, X, K, B, H, P Minimum degree $t = 2$

Case 3-a: key $k = B$ is not present in a internal node and the appropriate subtree that must contain k has only 1 key and one of the subtree's immediate siblings has at least 2 keys .

Deletion (B-tree)

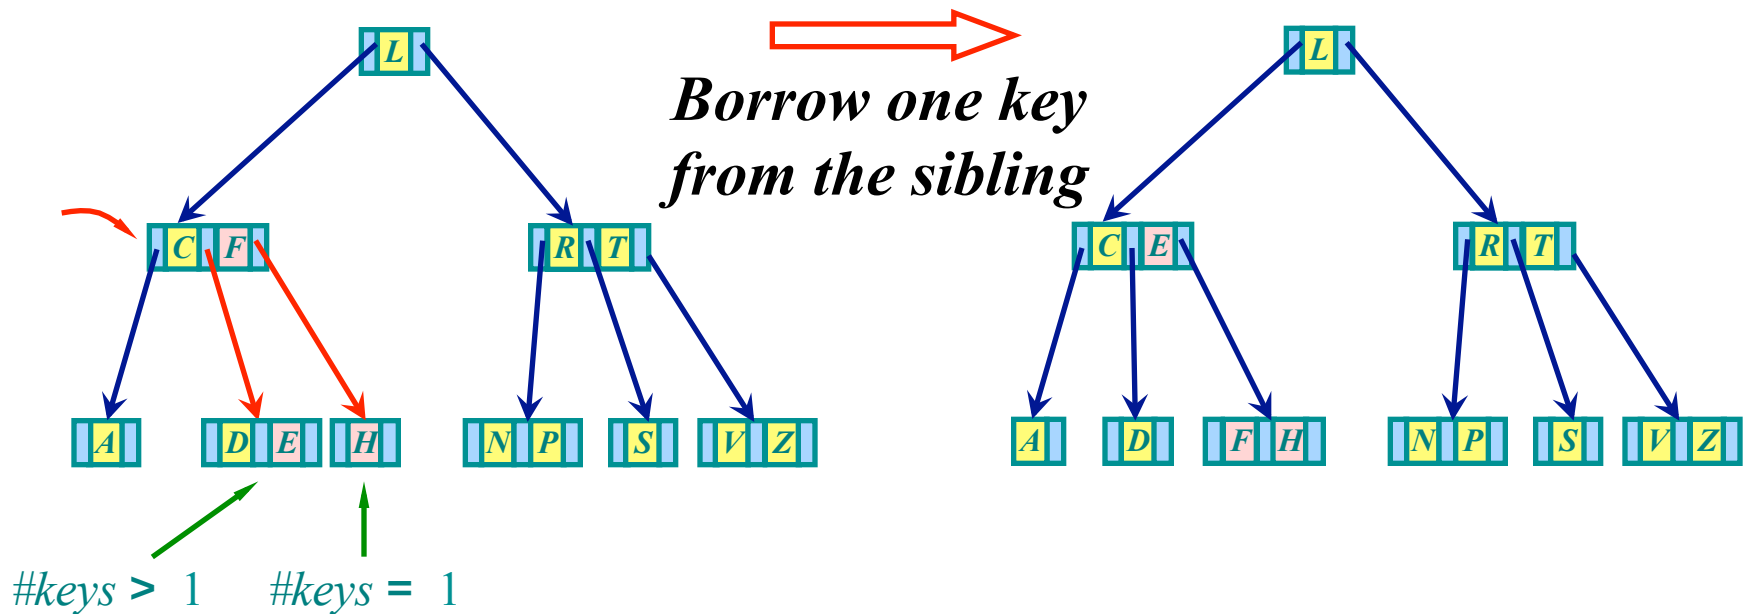

DELETE Y, W, Q, X, K, B, H, P Minimum degree $t = 2$

Case 2-a: key $k = B$ is in a internal node and one of its children that precedes or follows k has at least 2 keys.

Deletion (B-tree)

DELETE Y, W, Q, X, K, B, H, P Minimum degree $t = 2$

Case 3-a: key $k = H$ is not present in an internal node and the appropriate subtree that must contain k has only 1 key and one of the subtree's immediate siblings has at least 2 keys.

Deletion (B-tree)

DELETE Y, W, Q, X, K, B, H, P Minimum degree $t = 2$

Case 1: *key $k = H$ is in a leaf.*

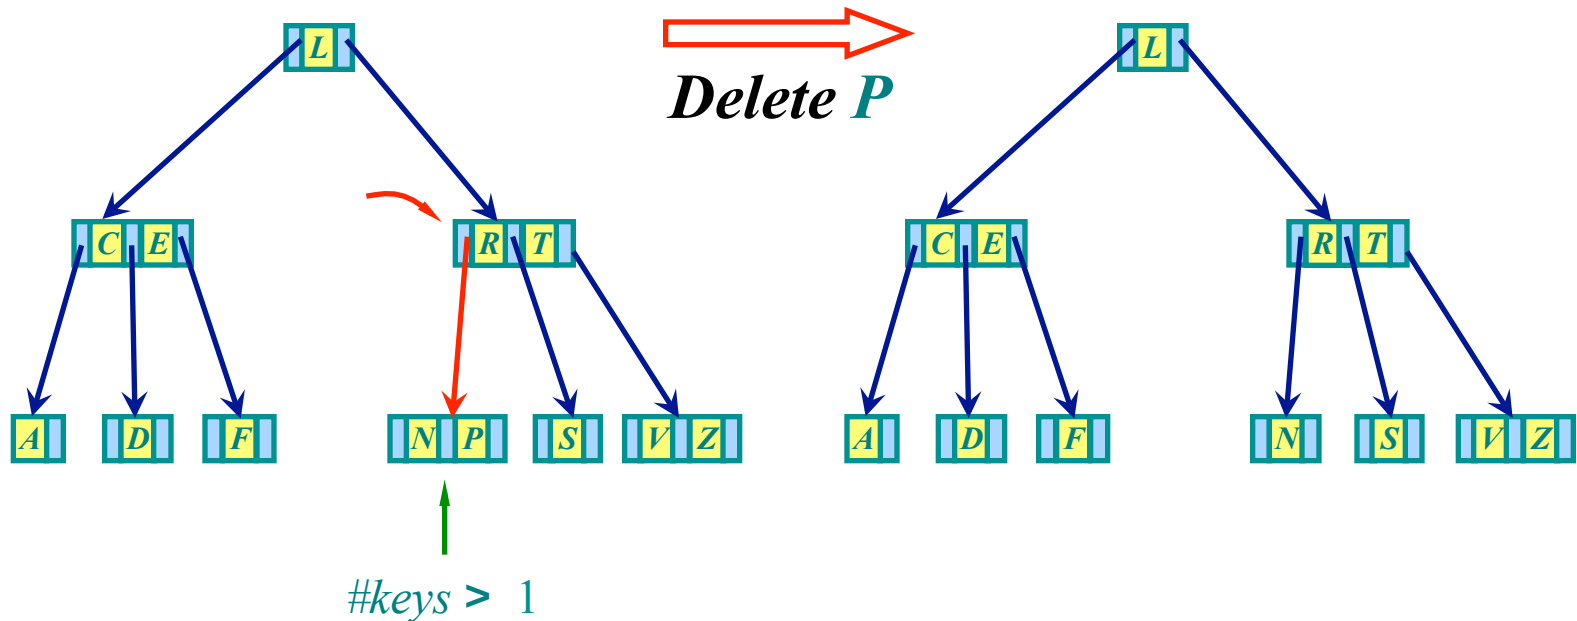

Deletion (B-tree)

DELETE *Y, W, Q, X, K, B, H, P* **Minimum degree** $t = 2$

Deletion (B-tree)

DELETE Y, W, Q, X, K, B, H, P Minimum degree $t = 2$

Case 1: *key $k = P$ is in a leaf.*

B-tree

Thinking and practice.

- Write code for **B-TREE-SEARCH**(x, k)
- Write code for **B-TREE-SPLIT-CHILD**(x, i, y)
- Write code for **B-TREE-INSERT**(T, k)
- Write code for **B-TREE-DELETE**(T, k)

How about B⁺ tree?

Any question?
